Title: Perfect score:

US-08-956-518A-85 10 1 TCTCCTTAAG 10

Scoring table: Sequence:

IDENTITY\_NUC

- L'abase :

N\_Geneseq\_36:\*

311585 segs, 125096042 residues

and is score

No. is the number of results predicted by chance to have a greater than or equal to the score of the result being printed, a derived by analysis of the total score distribution.

Rapid immuno:selection cloning - used to clone genes encoding cell surface antigens associated with mammalian T lymphocytes. Disclosure; fig. 10; 69pp; English.
CD20.4 encodes a cell surface antigen involved in cell mediated immunity. This DNA can be expressed in a vector which transforms COS cells. The vector can isolate any protein, and clones are easy to manipulate. Sequence 1473 Bp; 434 A; 321 C; 286 G; 432 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tyrosine suppressor gene; ASV LTR; human cytomegalovirus AD169 enhancer; HIV box; immunoselection; immune deficiency diseases; vasculitis; systemic lupus erythematosus; rheumatoid arthritis; neoplasms. New antigenic proteins from Plasmodium falciparum - new encoding nacid sequences and derived antibodies, useful in vaccines, diagnos Claim 1; page 23 and Table 18; 25pp; German.

The DNA encodes a malaria-specific P. falciparum 41kD protein (see P90419) is useful in a protective vaccine, esp. against malaria. Produced antibodies are useful reaseful on antibodies are useful on antibodies are useful as diagnos antibodies. See also N90211-25 and P90403-19.

                                                                  contg. epitope(s) of Plasmodium falciparum merozoite antigen, for use in malaria vaccines
for use in malaria vaccines
Figure 12a-12d; 67pp; German.
The genomic DNA of isolate RO-33 Ghana was largely identical to this genomic isolate of K1, whereas cDNA from M25 isolates differs
in 3 codons (see n9297). Plasmodium falciparum merozoite antigen can be coupled to an affinity peptide, or adsorbed or covalently bonded on a carrier. It, and its derivatives, are useful as immunogens anti-malaria vaccines. Antibodies directed against it are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  N90733

Claim 1; page 543; 7pp; japanese.

DNA is introduced into various kinds of plants to alter the nature of the chloroplast mambrane lipid phosphatidyl glycerol. It may also be used as a probe to allow cloning of enzyme genes which exist in closely related plants but which have slightly different substrate selectivity.

It contains the coding exons for murine light chain J regions 175. The probe was used to isolate the CC49 light chain for in the chain of the composed of the chain to compose the composed of the chains of heavy and light chains with high affinity for the composed of the constant regions from human constant regions from human constant regions from human constant regions are feeters when administered to human patients due to the constant before the constant constant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        See also

Plasmodium falciparum merozoite antigen can coupled to an affinity peptide, or adsorbed or covalently bonded on a carrier. It, and its derivatives, are useful a anti-malaria vaccines. Antibodies directed against it are passive immunisation and diagnosis.

                                                   removing poly adenylation signals in the gene.
Claim 22; Page 77; 144pp; English.
The insecticidal protein gene of B.t.t. was modified by site-directed mutagenesis to remove all putative polyadenylation signals and ATTTA sequences. The mutated sequence was inserted into a plant transformation vector such as pMONB93. The vector is then inserted into an Agrobacterium strain and used to transform potato, tomato and tobacco plants. Transformed plants were found to be resistant to Colorado Potato Beetle.

B.t.t insecticidal protein; polyade
Bacillus thuringiensis tenebrionis.
FD-20566
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Poly(A) mRNA is isolated from NDV-infected BHK-21 cells used to construct complementary DNA by usual methods and this inserted into PstI-cleaved pBR322. Recombinant plasmids were cloned in E.coli M294 and selected by hybridisation with a viral RNA probe 'Clone (designated II.14(F) contg. the longest insert was sequenced: it contains the claimed 1764-base sequence which codes for 526 AA protein consisting of two polypeptides linked by a pentapeptide region where proteolytic cleavage occurs. NDV fusion protein, and immunogenic polypeptide, are useful in vaccines for protecting poultry against NDV infection, and can be used diagnostically. Sequence 1764 BP: 522 A: 415 C: 385 G; 442 T;

This sequence is contained in a recombinant DNA molecule comprising e.g. a pUC19 or vaccinia virus vector sequence and regulatory elements. This allows efficient expression of the antigen on transformation of host cells. The P.vivax antigen prod. is useful in an anti-malarial vaccine for conferring immunity against the merozoite form of the parasite and preventing infection of uninfected red blood cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     enabling the mis-scheduled expression of the aban gene, indusabortive development in the fungus. This enables increased of medically or commercially important substances which are only produced by the fungi during conidiation.

A gene bank was constructed from E.coli MC 1061 containing plasmid pTZ19R containing the cDNA. Probes were synthesised based upon the amino acid sequence of A.flavus urate oxidase and these used to screen the gene bank. Five positive colonies were analysed; this is the sequence of the longest cDNA insert ("clone 9C"). See also Q10246-Q10253, Q10255.

CC mRNA was isolated from a urate oxidase-producing strain of A.flavus CC and reverse transcribed into cDNA. A gene bank was constructed from CC E.coli MC 1061 containing plasmid pTZ19R containing the cDNA. Probes CC were synthesised based upon the amino acid sequence of A.flavus CC urate oxidase and these used to screen the gene bank. Five positive CC colonies were analysed, one of which contained inserts of 1.2kb ("CC colonies were analysed, one of which contained inserts of 1.2kb ("CC colonies (substituted) bases are found to replace codons immediately downstream of the start ATG with codons typical of prokaryotic CC genes (substituted) bases are found at positions 6, 9, 21 and 42). CC The recombinant sequence was ligated to plasmid p462 to give p466. See also Q10245 and Q10247-Q10253 and Q10255. See also Q10245 and Q10247-Q10253 and Q10255. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                            Purified human pulmonary surfactant protein - useful for treating respiratory distress syndrome. Disclosure; Table 6; 15pp; English.

Protein is useful in treatment of respiratory distress syndrome membrane disease) enhancing pulmonary surfactant activity.

Protein is encoded by the cDNA insert in vector PSP 6K-I3-7.

                                                    DNA encoding sequences associated with human oncogenes - and derived antibodies, useful for in vitro diagnosis of cancer and for therapy.

Disclosure; Fig 3a-b; 92pp; French.
Derived peptides can fix GTP and GTP and have GTPase activity. Abs to these peptides can diagnose associated diseases - absence or exc the product indicates loss of balance between anti- and oncogenic f in the cells. The product may be used to treat conditions associate ras or rap genes.

Derived peptides can fix GTP and GDP and have GTPase activity. Abs rais to these peptides can diagnose associated diseases - absence or excess the product indicates loss of balance between anti- and oncogenic factor in the cells. The product may be used to treat conditions associated wires or rap genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Aspartic proteinase deficient filamentous fungi prepn. by pref. using a gene replacement vector, useful as hosts increased prodn. of heterlogous polypeptide(s). Disclosure; Fig 3; 64pp; English. Mutating the aspergillopepsin gene, a strain defficient in proteinase may be synthesised. The absence of such proteol improves the production of heterologous gene products, for

                                                                                           DNA coding for pectin lyase(s) PLA, PLB, PLC, PLE or PLF - used to produce pectin lyase(s) in pure form for constructing hybrid vectors expressing foreign genes. Claim 5; Fig 12; 63pp; English. Useful in production of hybrid vectors expressing the pectin lyase gene and/or hybrid vectors expressing foreign genes eg. interferon within a filamentous fungal expression system esp. Aspergillus nige sequence 3168 BP; 823 A; 780 C; 720 G; 845 T;

without selection pressure.

Claim 6; Page 23; 27pp; English.

Claim 6; Page 23; 27pp; English.

Plasmid pBF503 contains DNA fragment present in Brevibacterium stationis if o 12144, contains gene which stabilises plasmids in the bacteria, allowing maintainance with no selection pressure.

Tryptophan synthetase gene with associated promotor/operator system has
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA coding for pectin lyase(s) PLA, PLB, PLC, PLE or PLF used to produce pectin lyase(s) in pure form for constructing hybrid vectors expressing foreign genes.

Claim 4: Fig 11: 63pp; English.

Useful in production of hybrid vectors expressing the pectin lyase gene and/or hybrid vectors expressing foreign genes eg. Interferon within a filamentous fungal expression system esp. Aspergillus niger. Sequence 2774 BP; 653 A; 785 C; 673 G; 663 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           12-JUL-1990 (first entry)

Gene encodes function of maintaining a plasmid bacteria of the genus Brevibacterium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2104 CTGCACG

using Escherichia coli system including tryptophan promotor and
E.coli alkaline phosphatase signal peptide gene.
Disclosure; Fig 4; 23pp; English.
An E.coli strain transformed with the vector is useful for producing
hEGF in large pure quantities, with glycerol and/or glucose as a C-so
The hEGF is useful as an anti-cancer agent.

Nucleotide sequence encoding transforming growth factor beta-3 -used as a probe, or to produce TGF beta 3; for inhibition of growth of normal and neoplastic cells, eg A549.

This sequence encodes porcine transforming growth factor-beta 3 (TGF-beta 3) polypeptide. The nucleic acid sequence encoding this subtype is useful as a probe or to produce TGF-beta 3 for both normal and neoplastic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleotide sequence encoding transforming growth factor beta-3 -used as a probe, or to produce TGF beta 3, for growth inhibition of certain normal and neoplastic cells, eg A549.

Disclosure; Fig. 1b; 61pp; English.

Sequence encodes the 390 amino acid (AA) precursor transforming growth factor beta 1 (pre-TGF-beta 1) polypeptide. The 5' untranslated region of the TGF-beta 1 mRNA is 841 bases long, is purine rich and has a region of potential secondary structure. The TATA-like sequence in the 3' untranslated region of the gene is presumably a polyadenylation signal. Mature TGF-beta 1 comprises the C-terminal 112 AA's of pre-TGF-beta 1 and is cleaved at the Arg-Arg dipeptide preceding its NH2 terminus. The nucleic acid encoding the second subtype of TGF-beta (TGF-beta 3) is useful as a probe or to produce TGF-beta 3 for inhibition of growth of normal and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WO8912101-A.

This sequence encodes a protein which differs from human protein C at positions 156 and 157 (Lys-Arg is substituted by Asn-Ser). This creates a single uncleaved chain. The mutant product shows anti-coa activity when activated by the thrombin-thrombomodulin complex. It a lower activation rate and longer duration of activity compared withe native protein.

                                                                                                                                                                                                                                                                       PT having Gla domain replaced by the bovine Gla to increase calcium PT binding activity and improve activation
PS Claim 3; Page 14; 17pp; English.

CC Also claimed are its encoded human protein C, the gene structure conty.

CC Also claimed are its encoded human protein are for of comman protein C having gamma-carboxylated glutamic acid residues (Gla CC domain) has been replaced by the Gla domain of bovine protein C or by an equivilent of this bovine protein sequence w.r.t. its calcium binding CC activity, and/or its enhanced protein C activity. PCS4 was constructed CC from pCS1. DNA coding for part of protein C as removed from pCS4 by CC sail digestion at a site just upstream of the leader sequence-coding CC sequence and again at a site corresp. to the 45th (Val) and 46th (Asp) CC sequence these Sail sites and introduced into E. coli K12/HB101. The transformants harbouring a plasmid in an appropriate orientation, named CC pCS8, were screened and cultivated. pHSG293 was also constructed which casymmetric cohesive ends as pCs8 by digestion. The pCS8 was digested CC with BSTX1 and the 2 kb fragment was lighted with BstX1 digested which same asymmetric cohesive ends as pCs8 by digestion. The pCS8 was digested CC with BSTX1 and the 2 kb fragment was lighted with BstX1 digested pHSG293. The lighted bNA was packaged in vitro in a lambda phage packaging mixt. and transfected into E. coli K12/Om206. The DNA was isolated and introduced into CHO cells which were cultured to produce the hybbid corporation C. activated protein C inhibits blood coagulation of accelerates blood fibrinolysis and is used for treating blood coagulation disorders.
